

## MOBILE WIRELESS COMMUNICATION DEVICES WITH QUICK-SEND FEATURES AND METHODS THEREFOR

5

### FIELD OF THE INVENTIONS

10 The present inventions relate generally to wireless communication devices, and more particularly to mobile wireless communication devices having quick-send features and methods therefor.

### BACKGROUND OF THE INVENTIONS

15

20

Quick dialing features are known in cellular telephones. The Motorola StarTAC cellular telephones, for example, include a "Turbo Dial" feature that allows users to dial telephone numbers stored in memory locations 1-9 by merely depressing and holding a corresponding one of the input keys for a specified time interval. In the Motorola StarTAC phones, telephone numbers are associated with numeric input keys 1-9 by designating the corresponding memory location, i.e., locations 1-9, in which the telephone number is stored when the number is entered initially. Memory location 1 corresponds to numeric key 1, etc.

25

30

The Nokia 6100 series cellular handsets, by Nokia Mobile Phones Limited, include a "1-touch dialing" feature. In the Nokia handsets, telephone numbers are associated with input keys by entering the "1-touch dialing" mode, whereupon previously stored telephone numbers may be assigned to corresponding alphanumeric input keys on the keypad. Thereafter, stored telephone numbers may be dialed by depressing and holding the corresponding input key associated therewith for a specified time interval.

In known telephones having speed dialing features, the number of telephone numbers that may be assigned to alphanumeric input keys is limited by key availability, e.g., usually keys 1-9 in cellular telephones. Additionally, some phones reserve one or more numeric keys for the assignment of specific numbers.

5 In the Nokia 6100 series handsets, for example, input key 1 is reserved for the user's voice-mail number and input key 9 is reserved for speed dialing an emergency number.

U.S. Patent No. 5,710,810 entitled "Quick Dialing In A Mobile Phone", assigned to Nokia Mobile Phones Limited, discloses a quick dialing feature that allows users to associate several telephone numbers, e.g., "work", "home", "mobile", etc., with a particular name stored in memory. This supposed quick dialing feature however requires multiple inputs and scrolling to dial one of several telephone numbers stored in association with a particular name. Users must first display a list of stored names, and then select a name by scrolling through the displayed list, whereupon numbers, or indicia thereof like "home" "work", etc., associated with the selected name are displayed on a touch sensitive display. One of the displayed numbers may then be dialed by depressing the corresponding portion of the touch sensitive display, once or twice with a finger or an input device, associated with the desired number.

20 The various aspects, features and advantages of the present invention will become more fully apparent to those having ordinary skill in the art upon careful consideration of the following Detailed Description of the Invention with the accompanying drawings described below.

## BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is an exemplary schematic block diagram of a mobile communication device.

FIG. 2 illustrates several communication addresses associated with a common identifier, for example an individual's name.

FIG. 3 illustrates a schematic flow diagram for associating information stored in a wireless communication device, for example communication addresses, with one or more inputs of the same input key for quick transmission.

FIG. 4 illustrates several communication addresses of different individuals, each associated with corresponding key inputs.

FIG. 5 illustrates a memory address assignment configuration according to an exemplary embodiment of the invention.

## DETAILED DESCRIPTION OF THE INVENTIONS

The invention relates generally to wireless communications devices including mobile wireless communication devices, for example cellular telephones, pagers, personal digital assistants, wireless communication enabled laptop and notebook computers and other electronic devices.

FIG. 1 illustrates an exemplary schematic block diagram of a wireless communication device comprising generally a processor or micro-controller 10 coupled to memory 20, a transmitter/receiver 30, a display 40, and an input keypad 50 having a plurality of input keys.

5 The keypad of the exemplary embodiment is typical of that on a cellular handset and comprises a plurality of numeric input keys 0-9, function keys, including a "send" key 52 and a "stop" key 53, and a multi-position input device like thumb wheel or a scrolling device 54. In some embodiments, the numeric keys may also be capable of alphanumeric input. In other embodiments, the keypad includes discrete alphabetic input keys and numeric keys, for example as is common in wireless enabled laptop computers, some two-way pagers and other devices.

10 The memory is generally capable of storing information on the wireless communication device, including information to be transmitted therefrom. In one embodiment, the information is one or more communication addresses and in some embodiments a related identifier, for example a name or some identification code associated therewith. In the exemplary embodiment, the communication addresses include telephone and pager numbers, voice-mail box numbers, e-mail addresses, network addresses, like WWW and FTP URLs, among  
15 many others.

20 In one embodiment, multiple communication addresses are stored on the wireless communication device in association with a common identifier, for example an individual's name. FIG. 2 illustrates several communication addresses stored in association with an identifier in the memory of the wireless communication device. In one embodiment, each identifier and the corresponding communication addresses are stored in a common memory location, or address.

25 In another embodiment, each communication address is stored with a variation of the identifier in separate memory locations, for example "Han-W", "Han-H", "Han-C" and "Han-E, corresponding to work, home and cell phone numbers and an e-mail address, respectively, of Han. In this embodiment, the identifier "Han" is common to all of the communication addresses.

5 In FIG. 3, at block 300, information is entered into or stored by the  
phone, for example by entering the information when the communication device is  
in an input mode. In one embodiment, for example, the user enters a number and  
if desired a corresponding identifier in a particular memory address location by  
specifying the memory address associated with the particular input. In another  
embodiment, the user merely enters name and communication address  
information, without specifying a particular memory address whereupon the  
information is stored in the next available memory address. In this latter  
embodiment, the burden of having to specify the particular memory address where  
10 the information is stored is on the software.

15 In FIG. 3, at block 310, information stored on the wireless  
communication device is associated with at least one input from an input key on  
the wireless communication device. In one embodiment, the association is made  
manually upon entering information in a particular memory address, for example,  
during a data input mode, as discussed above. In another embodiment, the  
information is associated with the input key after the information is stored in  
memory, without the user specifying the memory address in which the  
information is stored. In the latter embodiment, the information may be  
associated with the input by entering a "set-up" mode, similar to the "1-touch  
dialing" mode of the Nokia 6100 series handsets. The input key may be associated  
20 with the assigned information by a look-up table or by other means, or the  
information may be moved from its original memory address location to the  
memory address location corresponding to the number on the input key upon  
assignment of the communication address to a particular input key or several  
25 inputs thereof.

In one embodiment, information to be transmitted from the wireless  
communication device is associated with a plurality of at least two sequential

inputs of the same input key on the wireless communication device. In another embodiment, a first communication address is associated with a single input of an input key and a second communication address is associated with two inputs of the same input key as the first communication address. In other embodiments, another communication address is associated with three inputs of the same input key as the first and second communication addresses. Additional addresses may be associated with additional inputs of the same input key.

In one application of the invention, a plurality of communication addresses related to the same individual are all associated with the same input key, for example, the "6" key of the wireless communication device, and another plurality of input addresses of another individual are associated with another input key, for example, the "7" key. The communication addresses associated with a particular identified are distinguished by the number of key inputs. For example, in one embodiment, a first communication address is associated with one input of an input key, a second communication address is associated with two inputs of the same input key, and a third communication address is associated with three inputs of same input key, etc.

FIG. 4 illustrates in tabular form several communication addresses for "HAN" and the associated inputs of the numeric key "1". The communication addresses of another person are associated with corresponding inputs of the numeric key "2", and so on. The communication addresses related to other identifiers may be associated with corresponding inputs of other keys, including alphabetic or numeric or alphanumeric keys, or even function keys. In cellular telephone handset applications, the alphanumeric keys 0-9, since some users may already be accustomed to associating telephone number with numeric input keys.

In one embodiment, the number of inputs of an input key corresponds to the decimals of the memory location address. In FIG. 4, for

example, the "Work" number of "HAN" is stored in memory address location "1", the "Home" number of "HAN" is stored in memory address location "11", and the "e-mail" address of "HAN" is stored in memory location "1111". The memory address location associated with a particular communication address may be specified by the user during data entry, or the communication address data may be moved from its initial memory address location to the memory address location corresponding to the particular key inputs upon making the association. This may be performed under control of software of the wireless communication device.

In applications where memory is relatively limited, for example, where there are only addresses 0-99, the address "111", "1111" "222" and "2222", etc. corresponding to communication address assignments that exceed address 99 may be arbitrarily assigned to other portions of memory. FIG. 5 illustrates a portion of physical memory having addresses 0-99, and additional unordered addresses "111", "1111", "222", "2222", etc, which only marginally increases the size of the memory. Alternatively, memory addresses within the range 0-99 may be reassigned new addresses, for example memory addresses "12" and "13" may be reassigned the addresses "111" and "1111", respectively.

FIG. 3 illustrates, at block 320, transmission of the communication addresses associated with particular key inputs. In one embodiment, transmission of a communication address or other information from the wireless communication device is performed by inputting and maintaining the last of the key inputs for a minimum input time interval. Where a single key input is associated with a particular communication address, for example the "1" input key in FIG. 4, the associated "work" telephone number for "HAN" is transmitted upon depressing and holding the "1" key for a predetermined time interval. Depressing the input key for a predetermined time interval is functionally equivalent to the "send" function on some cellular handsets. Continuing with the

example, the "Home" telephone number for "HAN" is transmitted by sequentially depressing the "1" key twice, within a software specified time interval that would capture two sequential inputs by most users, and then maintaining the "1" key input for another predetermined time interval.

5 While the present inventions and what is considered presently to be the best modes thereof have been described in a manner that establishes possession thereof by the inventors and that enables those of ordinary skill in the art to make and use the inventions, it will be understood and appreciated that there are many equivalents to the exemplary embodiments disclosed herein and that myriad modifications and variations may be made thereto without departing from the scope and spirit of the inventions, which are to be limited not by the exemplary embodiments but by the appended claims.
